AutoCare: Final Project Review

8 November 2026 • Assignments 1-6 • Implementation commit 5a9040c

Team: AutoCare | **Group:** SE2508.
Members: Alan Akylbek, Aitemir Nazimov, Beksultan Amantai.

Objective

Review the latest website against all six supplied assignment briefs, correct the identified omissions and defects, and preserve the original colors, typography, assets and overall composition. This document records the final audit; it does not replace the history of individual submissions.

Changes made

Expanded the carousel from six to nine slides. Added a nine-image CSS Grid gallery with hover and keyboard-focus captions. Implemented named Grid areas on Services. Team cards now use Flexbox, circular SVG images retaining the original initials, and links to the relevant pages.

Added author comments, images on Booking and the Media Queries exercise, and navigation on the exercise page. Fixed shared feedback styling there. Set dimensions for deferred images, added a local fallback for jQuery 4.0.0, and reset stale clipboard feedback before another attempt.

Reconciling the assignment stages

Assignment 1 originally prohibited Bootstrap; Assignment 3 requires Bootstrap and Assignment 6 requires jQuery. The integrated final version follows the later library requirements. The Media Queries exercise remains free of Bootstrap. Earlier ZIP archives have been preserved.

The Assignment 3 instruction to replace every spacing declaration with Bootstrap utilities is not implemented literally: utilities, including responsive ones, are used, while custom design spacing remains to honor the request to preserve the appearance. This is an explicit limitation, not a claim that all historical rules can be satisfied simultaneously.

Published website and source

1. HTML and CSS

Assignment 1 • Content, structure and shared styling

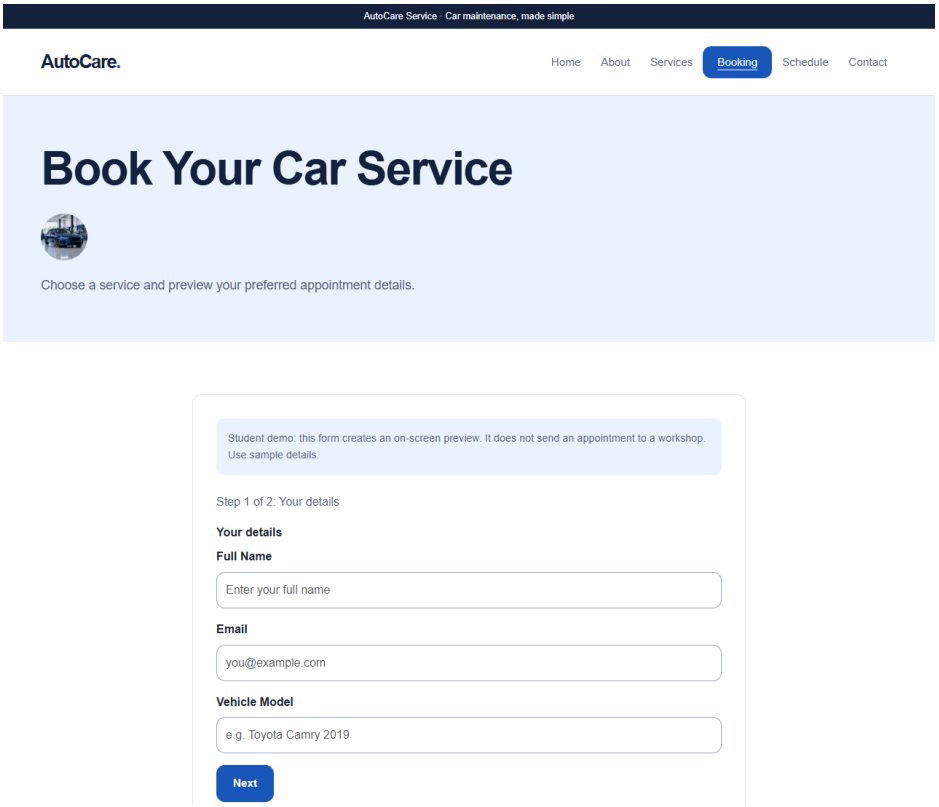

Verified: six main pages plus an additional exercise; doctype, lang, charset, viewport and page titles; shared external CSS; navigation and footers with all three names; headings, lists, a three-column schedule table and forms.

Corrected: author comments in the head of every page; images added to Booking and Media Queries. On About, initials are now actual SVG images styled with border-radius: 50%, retaining their previous visual appearance.

Team content: About describes all members. Services and Contact identify the members responsible for those page pairs. The existing project assigns Alan to Home/About, Aitemir to Services/Booking, and Beksultan to Schedule/Contact. Actual authorship and participation must be confirmed by the team members themselves.

Verification steps: open each page and follow navigation links; check its footer. Open Schedule for the table, Contact and Booking for forms, and About for circular images and biographies.

Code: the seven HTML files and css/style.css. The shared stylesheet includes element, class, ID and descendant selectors, typography, colors, form styling, borders and focus indicators.

Booking retains its original form and visual treatment. The small circular illustration supplies the required image on this page.

2. Flexbox and CSS Grid

Assignment 2 • Cards, named areas and image gallery

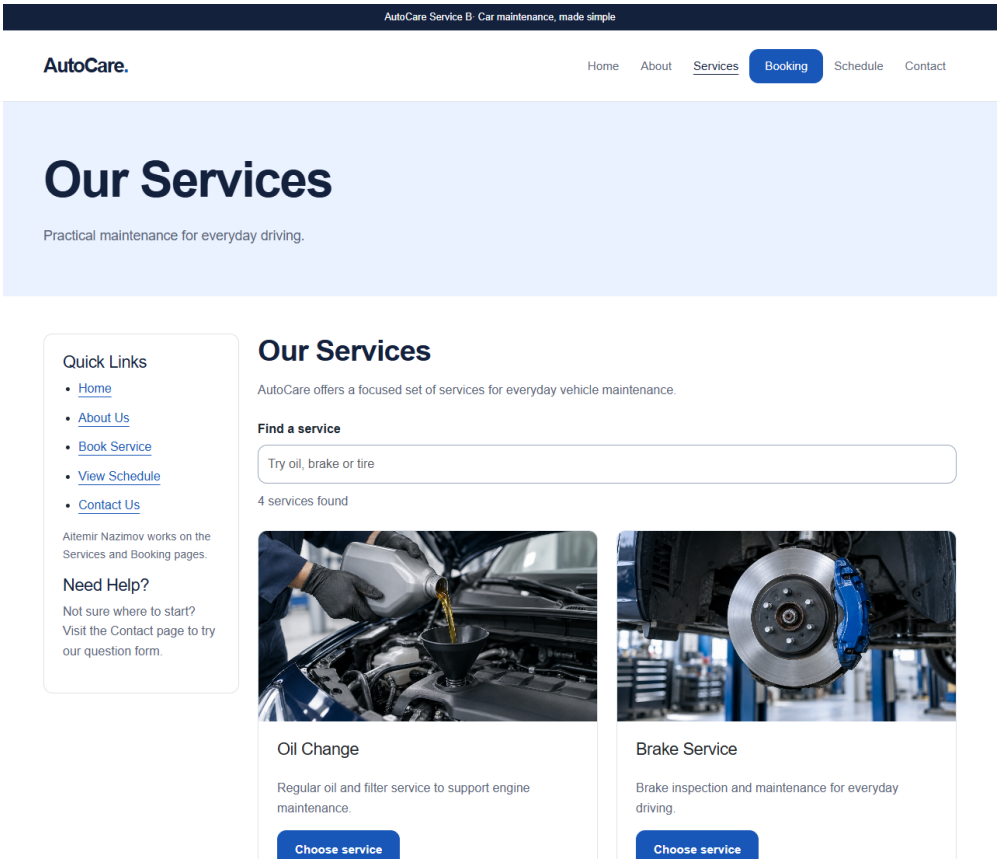

Navigation: a flex container aligns the logo and links. About team cards include an image, title, description and action. Flexbox controls equal-height cards and wrapping; hover adds a subtle shadow.

Grid areas: body.services-page explicitly defines note, header, sidebar, main, benefits, cta and footer. The sidebar is on the left at desktop width and above the content on smaller screens.

Gallery: About contains nine images in .workshop-grid. Columns change from three to two to one. Captions appear on hover or keyboard focus and stay visible on small screens.

Verification steps: open About, hover over a card and gallery image, then use Tab to focus the gallery figures. Open Services and reduce the window width. All gallery assets come from the existing project.

Code: about.html, services.html and the Final audit section of css/style.css. The implementation uses display: flex, grid-template-columns, grid-template-areas and grid-area.

3. Responsive Layout

Assignment 3 • Media queries and Bootstrap

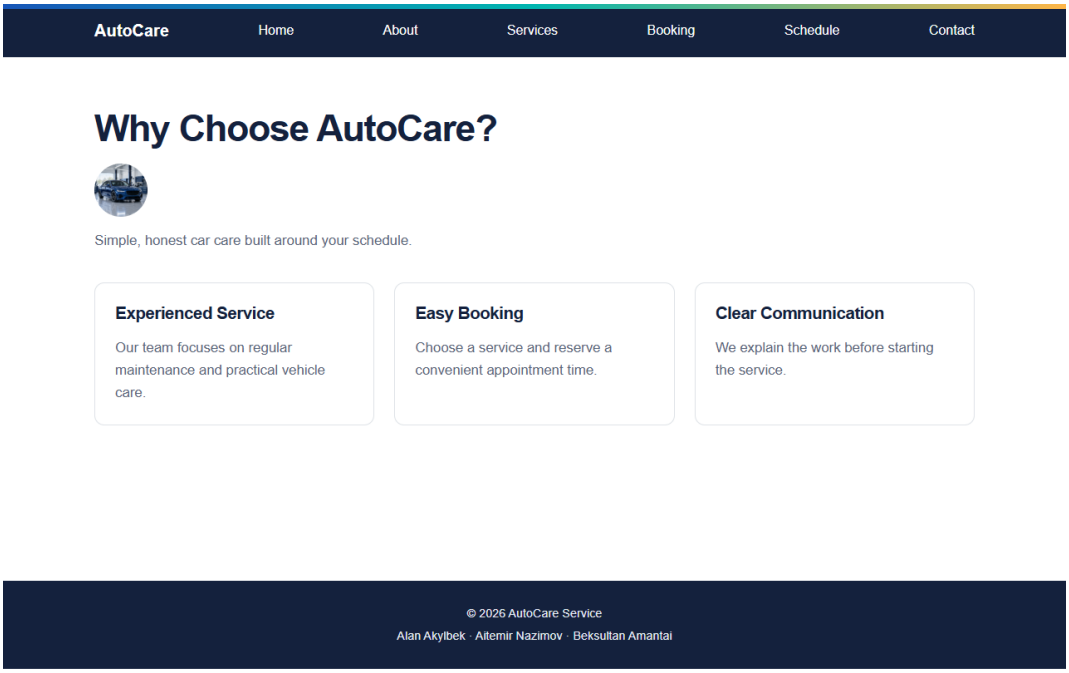

Media Queries: a dedicated page without Bootstrap changes heading and paragraph sizes for mobile, tablet and desktop. Cards use one, two and three columns respectively. Shared styles load first, followed by the exercise-specific CSS.

Bootstrap: two-column Home/Contact sections, a three-column contact section, container, row and col classes; spacing utilities including mt-3 mt-lg-4; navbar-toggler, btn and btn-group; form-control, form-select and form-check.

Corrected: About now has nine carousel slides and nine indicators. Opening the ninth slide was verified. The card-group contains three cards with actual circular images. Semantic elements and visible focus indicators remain in place.

Verification steps: use widths of 360, 768 and 1280 pixels; expand the navigation menu on a small screen. On About, use carousel controls and indicators. Check the standalone Media Queries page separately.

Limitation: custom design spacing remains alongside Bootstrap utilities. Replacing every margin and padding declaration would change the preserved design and the custom CSS teaching examples.

4. JavaScript Basics

Assignment 4 • All five interaction tasks

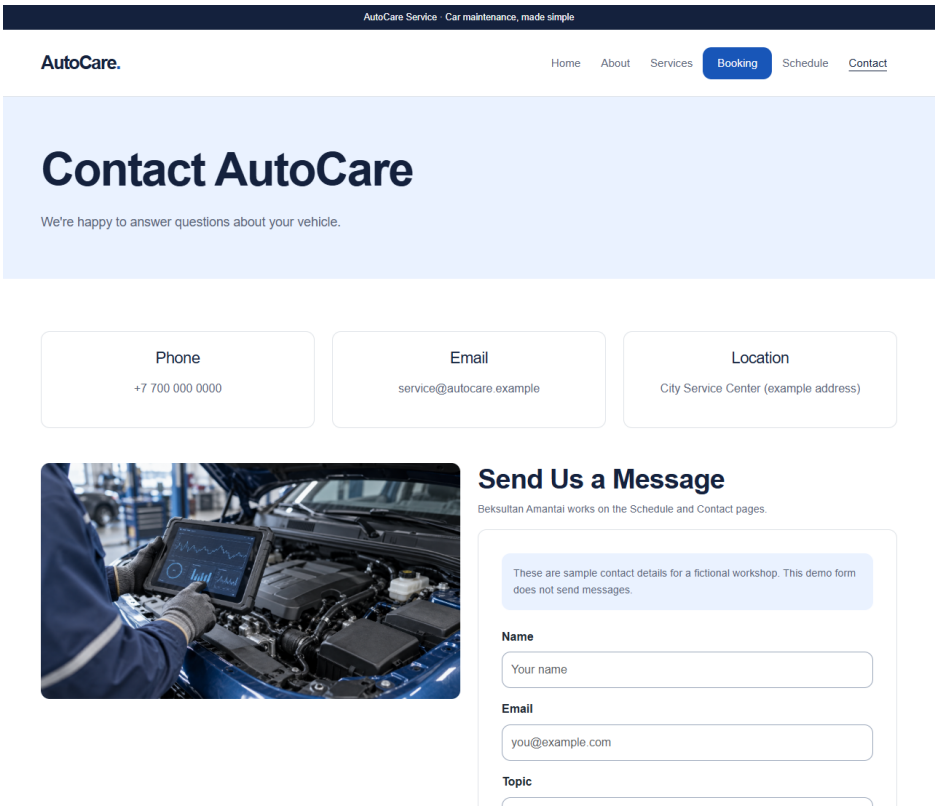

1. Validation: required and whitespace-only inputs, email format, minimum password length and confirmation matching. Booking additionally rejects past dates and Sundays. An error appears near the form and focus moves to the invalid field.

2. FAQ: answers start hidden. A button expands and collapses each answer with a transition; aria-expanded and aria-hidden are updated.

3. Popup: Subscribe on Contact opens a dialog. Escape, Close and clicking outside dismiss it. Closing resets the fields and returns focus to the opening button.

4. Background: Change background on Home cycles through predefined colors. **5. Date/time:** Schedule displays a Date value and updates every second using the visitor device time zone.

Code: js/main.js: validateForm, FAQ, Subscription popup, Background color and updateClock. **Checks:** empty inputs, invalid email, short and mismatched passwords, valid input and popup dismissal methods.

5. Advanced JavaScript

Assignment 5 • Requirements combined into useful interactions

DOM and styles: querySelector/querySelectorAll, textContent changes after actions and backgroundColor changes. The chosen Manipulating Attributes option is Read More on About.

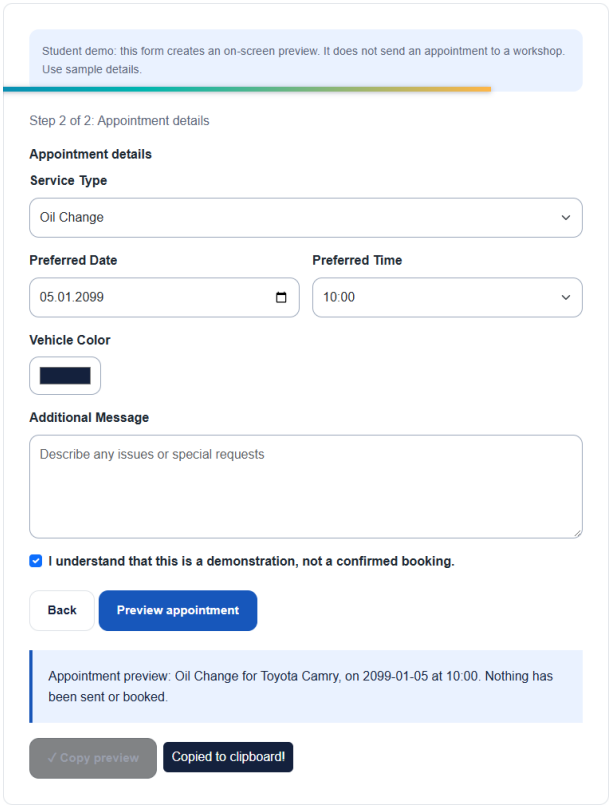

Events: addEventListener handles buttons. keydown and switch move focus through the menu with wraparound. forEach registers listeners on the link collection.

Callback and state: Next/Back in the existing Booking form call the step functions. Two fieldsets retain values in the DOM. The steps array and a for loop display the selected step.

Object and method: appointment stores the details; getSummary builds the result. A valid preview plays one short sound. pause and currentTime = 0 prevent overlapping playback.

Animation and structure: user actions trigger CSS transitions on FAQ answers and the background. HTML, CSS and JavaScript remain separate, with no inline event handlers. Reduced-motion preferences are respected.

Assignment 6 integration: after validation, main.js passes a callback to the jQuery preview:ready handler. It shows loading feedback and then runs the original preview and sound.

6. jQuery

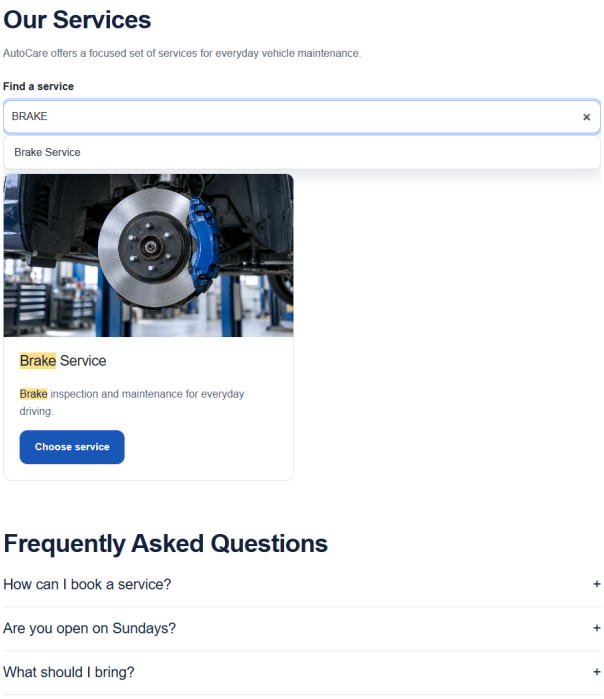

Assignment 6 • Tasks 0-9

0: jQuery 4.0.0 CDN in the head, ready handler and console message; a local copy loads if the CDN is unavailable.
1-3: Services filters titles/descriptions, offers mouse/keyboard suggestions and highlights every occurrence in searchable cards. Clearing restores the original text.

4: gradient scroll progress on every page.
5: project fact counters 5/3/2 start when visible.
6: a valid Booking submission displays a spinner and disables controls for one second, then restores them.

7: temporary notification with fadeOut.
8: actual preview copying; checkmark and tooltip appear only after success. Permission failure produces honest guidance. Old success feedback is cleared before another attempt.
9: data-src becomes src when images enter the viewport. Image dimensions reserve space before loading.

Code: js/assignment6.js and css/feedback.css. Fallback files: js/jquery-fallback.js and vendor/jquery-4.0.0.min.js. Clipboard operations require HTTPS or localhost and browser permission.

Verification and Conclusion

Evidence scope and practical limitations

368 browser checks: 100 jQuery/regression checks plus 268 extended assertions. Chrome and Edge; viewport widths include 360, 390, 768 and 1280 pixels across the two suites. These are desktop-browser viewport checks, not physical-device tests.

177 local references: HTML, CSS, JavaScript, image and audio paths resolve. No inline on* event handlers were found. Unique IDs, images on every page and all three member names in footers were verified.

Interactions: search and special characters, suggestions, clipboard success/denial, notifications, counters, lazy loading, form/password/date checks, audio, FAQ, clock, background, Next/Back, menu, Grid areas, nine slides and nine gallery images.

jQuery fallback: a separate scenario replaces the CDN response with an empty script. The local copy successfully enables search. A real network outage may still produce a failed CDN network request in the console, but the fallback keeps functionality available.

Results: no JavaScript or console errors were observed during normal browser checks. The published final version also passed checks for nine slides, gallery, search, delayed preview, real clipboard copying and shared feedback CSS. These results cover the tested scenarios, not every possible device or condition.

Conclusion and demo boundaries

The final review corrected the identified gaps while preserving the existing design. Booking, Contact and Subscribe display local previews only: there is no server, message delivery, real reservation or account creation. Form values are not retained after reload.

Submission

Use the final ZIP and this review alongside the individual assignment reports if required by the instructor. Earlier reports document earlier versions. Each member submits and defends the work individually; automated tests cannot verify deadlines, historical authorship or defense performance.
